hypothetical protein YPL088w - yeast (Saccharomyces cerevisiae)
N;Alternate names: hypothetical protein LPG20w
C;Species: Saccharomyces cerevisiae
C;Date: 10-Apr-1996 #sequence_revision 19-Apr-1996 #text_change 18-Feb-2000
C;Accession: S61978
R;Wang, Y.; Ahmed, A.; Bussey, H.; Fortin, N.; Friesen, J.D.; Hall, J.; Sto
A;Gene: MIPS:YPL089c
A;Map position: 16L
C;Superfamily: fission
                                                                                                 A; Molecule type: DNA
A; Residues: 1-342 <WAN>
                                                                                                                                             submitted to the EMBL Data Library, A;Description: The sequence of Sacci A;Reference number: S61959 A;Accession: S61978
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Вþ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Ş

The erythromycin gene cluster spans approximately 53 kb and contains at least 20 open reading frames (ORF). This sequence contains the eryBII, eryCIII and eryCII genes encoding ORFS 7, 8 and 9 respectively. A DNA representing the eryAII-eryK region of the same cluster is shown in AAX25774. The genes are used to produce hybrid secondary metabolites in S.erythraea, i.e. erythromycin analogues which may homologous genes involved in glycosylation of macrolactones in macrolide-producing strains (specifically oleandomycin-producing strains of Streptomyces
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         This sequence represents the eryG-eryAIII gene cluster from the Gram-positive bacterium Saccharopolyspora erythraea which encodes enzymes involved in the production of the macrolide antibiotic erythromycin as a secondary metabolite. The erythromycin gene cluster
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Claim 1; Fig 2; 221pp; French.

The eryB genes are involved in the biosynthesis of L-mycarose and the eryC genes involved in the biosynthesis of D-desoamine. Novel glycosylation-modified polyketides are produced by selectively altering, inactivating or augmenting these eryB and/or eryC genes and introducing them into polyketide-producing
                                                                                                                                                                                                                                                                                           3107

                                                                                                                                                                                                                                                                                                                The invention relates to a 10 kb genomic DNA isolated from S. avermitilis that contains genes encoding proteins for glycosylation of avermectin aglycones. The polypeptides can be expressed by standard recombinant methodology. The gene and the encoded polypeptides together with other enzymatically active polypeptides, are useful to perform combinatorial blocatcalysis in vitro and in vivo in a host cell. They are useful for performing blotransformations on macrolide compounds including avermectin or other macrolide aglycones. The sequences are also useful in vivo in a bacterial host, in vitro in combination with an actionmycete
                                                                                 8784
                                                                                                                                                                                                                                                fermentation, and in vitro in combination with enzymatically active polypeptides that are not from the avermectin biosynthetic pathway to effect the synthesis of a from the avermectin active compound, e.g. an antibiotic. The present sequence represents the 10 kb genomic fragment that contain genes involved in the synthesis and/or addition of oleandrose to avermectin aglycones.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        CDS

                                                                                                                                                                                                                                                                                                                                                                                                                                                 CC (1); (3) production of expression products by culturing cells of (2); (6) expression products, or their fragments, of (1) and synthetic CC proteins or peptides with the same sequences (A); (5) poly- or CC mono-clonal antibodies (Ab) that react specifically with (A); (6) thyridoma cells that produce the monoclonal Ab of (5); (7) transgenic CC plants that contain transformed or transfected cells of (2); (8) CC detecting KT2440 using a labeled (1) or Ab as probe; and (9) DNA chips CC carrying one or more (I). (I), and their fragments, are used as probes CC to detect and isolate full-length cDNAs and/or to amplify such cDNAs by CC polymerase chain reaction, and for production of transgenic plants. (I), CC or antibodies that recognize their expression products, are used for CC detecting the presence of KT2440, particularly in presence of other, CC even closely related, bacteria. KT2440 is one of the bacteria classified as safe, by the National Institutes of Health, for genetic engineering CC and as vaccine carriers. (I) are exclusive to KT2440 with no significant CC and as vaccine carriers. (I) are exclusive to KT2440 with no significant conditions of the production of the bacteria, it chas greater catabolic activity and better survival in, and adaptation to, the rhizosphere and soil
                                                                                                                                                                                                                                                                                                                                                                   Matches 400;

The present sequence represents DNA comprising a gene specific for 5S CC clavam biosynthesis from Streptomyces clavuligerus (SC) and which is not essential for 5R clavam biosynthesis. The present invention also CC describes: (1) a process for improving 5R clavam production in a comprise of the present invention also companies comprising manipulation of DNA as above and its inclusion in the microorganism; (2) a process for improving 5R clavam cC production in SC comprising disrupting or otherwise making defective DNA regions flanking cas 1; (3) a process for the identification of, a comprising suitable for high 5R clavam production comprising a comprosing suitable for high 5R clavam production comprising a comprising suitable for high 5R clavam production on 5S clavam cC production; (4) a microorganism which is capable of 5R clavam production and low or no 5S clavam production obtainable by a process as in (3); (5) clavulante acid (CA) obtainable by the fermentation of a comprising a clavam sin (4), and (6) CA which is free of any 5S clavam; (7) cc and the used to produce organisms capable of producing increased amounts of clavams suitably e.g. CA, for use as antiblotics. The methods can also be used to production of CA without the production of 5S clavam or clavam-2-caproxylate.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present sequence represents DNA comprising genes specific for 5S clavam biosynthesis from Streptomyces clavuligerus (SC) and which are not essential for 5R clavam biosynthesis. The present invention also describes: (1) a process for improving 5R clavam production in a suitable microorganism comprising manipulation of DNA as above and its suitable microorganism comprising the process for improving 5R clavam
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      inclusion in the microorganism; (2) a process for improving 5R clavam production in SC comprising disrupting or otherwise making defective DNA regions flanking cas 1; (3) a process for the identification of a microorganism suitable for high 5R clavam production comprising a preliminary screening for microorganisms with low or no 5S clavam production; (4) a microorganism which is capable of 5R clavam production and low or no 5S clavam production obtainable by a process as in (3); (5) clavaliante acid (CA) obtainable by the fermentation of a microorganism as in (4), and (6) CA which is free of any 5S clavam; (7) CA which is free of any clavam-2-carboxylate. The methods and products can be used to produce organisms capable of producing increased amounts of clavams suitably e.g. CA, for use as antibiotics. The methods can also be used for the production of CA without the production of 5S
                                                                                                                                                                                                                                                                                                              1195
